

CYBERHEIST

sheets

2	Main menu	entry point, run continuation, meta hubs
3	Contract screen	the job: name, goal, brief, proceed
4	Class + starting deck	pick a class, see the deck it gives you
5	Run map	branching route from entry to target
6	Intrusion screen	the core loop — detection, enemy, hand
7	Card anatomy	every field on a card, zoomed
8	Shop + node reward	spending credits between fights
9	Pause + run summary	the two small full-screen states
10	Safehouse	between-run toolkit upgrades
11	Sources	fonts, libraries and references used

how to read these sheets

-  solid outline = interactive control
-  hatched = art / placeholder asset
-  dashed = dynamic, animated or hidden state
-  circled number = annotation, see right column
-  highlight = open question for the team

nothing here is final — proportions are indicative,
copy is placeholder, colour comes later.

Main menu

first screen after launch

CYBERHEIST — UI mockups

sheet 2 / 11

target 16:9 — everything scales from a 1920x1080 reference

1 Wordmark + tagline

Static logo lockup, top-left rather than centred, so the menu reads as one vertical block and the background art stays visible.

2 Menu column

Five entries, keyboard and controller navigable. Selection is the block fill plus a one-frame glitch on change; hover and focus use the same visual.

3 Continue run

Dimmed when no save exists. Mid-run it shows contract name and current phase underneath.

4 Safehouse

Entry to meta-progression — toolkit upgrades bought with intel between runs (sheet 10).

5 Profile chip

Persistent handle, intel balance and run count. Also the entry point to the lifetime stats screen.

6 Background plate

Ambient looping art carrying no gameplay information. Must stay legible behind the menu at 60% opacity.

Contract screen

the job, before the run starts

CYBERHEIST — UI mockups

sheet 3 / 11

one job on screen at a time — arrows cycle the offers, Proceed commits

- 1 **Name block**
Target name and logo plate. Kept as its own boxed element so the brief reads as a physical job sheet rather than a menu.
- 2 **Goal**
The win condition in one line, in plain language. Every other number on this screen is secondary to it.
- 3 **Brief panel**
One frame holds the whole contract. No tabs, no scrolling — if it does not fit here, it does not belong on this screen.
- 4 **Stat rows**
Sector, length, heat and payout. Length is the honest one: it tells the player how long they are signing up for.
- 5 **Offer cycling**
Arrows step through the three available jobs in place, so the layout never changes between offers.
- 6 **Proceed**
Single commit point, centred and the heaviest control on screen. Leads to the class screen (sheet 4).
- 7 **Back**
Quiet text link, deliberately low contrast. Nothing is lost by leaving, so it does not need weight.

Class + starting deck

chosen after the contract, before the map

CYBERHEIST — UI mockups

sheet 4 / 11

the deck grid is the whole point — you pick the class by reading the cards it hands you

- 1 Class plate**
Art, one-line temperament and the two numbers that differ between classes. Everything else about a class lives in its cards.
- 2 Class cycling**
Same arrow pattern as the contract screen. Class name and deck swap together, in place.
- 3 Deck grid**
The full starting deck, face up, before committing. No summary text can replace seeing the fourteen cards.
- 4 Card faces**
Cost pip plus rules-text lines only, at this size. Clicking one opens the full card from sheet 7.
- 5 Class stats**
Starting integrity and cycles per turn. Two rows, because a third would invite a stat block nobody reads.
- 6 Proceed**
Same weight and wording as the contract screen, so the two commit steps feel like one flow.
- 7 Deck makeup**
Type breakdown under the grid — the quick read for players who already know the cards.

Run map

the route from entry point to target

hand-placed node graph, left to right — every branch reconverges on the target

- 1 Entry node**
Square, not a circle — the two fixed points of a run are shaped differently from the ones you choose between.
- 2 Node graph**
Hand-authored shapes, procedurally filled. Only nodes joined to the current one are selectable, and no route skips a branch.
- 3 Current position**
Cleared nodes fill in and lock; the ring shows where the player stands. Backtracking is not allowed.
- 4 Node tooltip**
Hover gives type and reward, never the exact enemy composition. Enough to plan a route, not enough to remove the risk.
- 5 Target node**
Every path reconverges here, so the run always ends on the contract objective rather than wherever the branch ran out.
- 6 Heat + inventory**
Credits, deck size and run heat, always in the header strip. Heat carries across nodes and never fully resets.
- 7 Node key**
Permanent legend rather than a one-time popup — the icon set does not have to be self-explanatory.

Intrusion screen

the core loop — where most of the play time goes

CYBERHEIST — UI mockups

sheet 6 / 11

drawn taller than 16:9 so the hand stays readable at this size

- 1 Detection bar**
The second loss condition, top-left where the eye starts. Alert and lockdown ticks are marked so a loud turn can be taken on purpose.
- 2 Enemy plate**
One combined art panel for the node and whatever defends it. Big, central, and the only illustrated element in the fight.
- 3 Intent**
Next turn's action and its number, above the enemy. Always visible — the fight is about planning, not guessing.
- 4 Status chips**
Per-target states sit beside the bar they modify, never in a separate tray.
- 5 Player**
Avatar, integrity, buffer and traced stacks in one bottom-left cluster, mirroring the enemy block opposite.
- 6 Energy**
Per-turn resource, large and next to the hand because it is checked on every card decision.
- 7 Hand**
Five cards, hovered card raised. Each shows its noise cost, so the detection tradeoff is visible before committing.
- 8 End turn**
Far bottom-right, well clear of the cards, with the pile counts underneath rather than as separate widgets.

Card anatomy

one template, five card types

CYBERHEIST — UI mockups

sheet 7 / 11

- 1 Cost**
Cycles to play. Top-left, the largest single glyph on the card — it is the first thing read when scanning a hand.
- 2 Name**
Real technique names wherever possible. Right-clicking the name opens the codex entry behind it.
- 3 Art window**
Fixed aspect, so base and upgraded versions of a card stay interchangeable assets.
- 4 Type banner**
Type left, rarity right, in one strip. Frame stroke also thickens with rarity, so rarity survives without colour.
- 5 Rules text**
Two lines at the template size. If it needs three, the card is too complicated and gets cut.
- 6 Noise**
Added to the detection meter on play. Always bottom-left, always red, on every card without exception.
- 7 Keyword slot**
Exhaust, ethereal, innate and so on — bottom-right, one keyword per card maximum.
- 8 Upgrade pip**
Marks an upgraded card. The CVE-style line under it is pure flavour and carries no rules weight.

all five types share this template and differ only in banner, frame weight and noise budget

Shop + node reward

the two ways cards enter a deck mid-run

CYBERHEIST — UI mockups

sheet 8 / 11

1 Stock grid

Nine tiles, name and price only. Stock is rolled per shop node and never restocks, so the grid can stay static.

2 Selected item

Clicking a tile draws the connector and fills the detail panel. Selection never opens a modal — the whole shop stays on one screen.

3 Buy

Disabled and dimmed when the price exceeds credits on hand, with the price turning red rather than showing an error.

4 Credits

Balance top-left, in the same place as the detection bar in a fight — the number that constrains this screen.

5 Card removal

Priced as a service, not stocked as an item. It is the only way to shrink a deck mid-run.

6 Reward tiles

Same tile as the shop grid with the price removed, so a card looks the same wherever it is offered.

7 Skip

Trading the card for credits, which feeds straight back into the shop. Always available.

reward screen reuses the shop card tile, minus the price

Pause + run summary

the two full-screen interrupts

CYBERHEIST — UI mockups

sheet 9 / 11

1 Paused

Title carries the state; no icon needed. The overlay dims the run behind it rather than replacing it.

2 Button stack

Four entries, one column, resume highlighted as the default. Same button component as every other primary action in the game.

3 Settings + exit

Settings opens in place, over the pause layer. Exit asks for confirmation only when a run is unsaved.

4 Escape behaviour

Esc opens and closes. Nothing on this screen loses progress, which is why none of it is red.

5 End state heading

Win and loss share one layout — only the heading, the row set and the accent colour change.

6 Stat rows

Fixed key-value list. A loss swaps the credits row for "killed by", since unspent credits do not carry over.

7 Detection graph

Per-node trace of the whole run. The post-mortem: players can see the node where it got away from them.

both are overlays on a dimmed game screen, not separate scenes to load

persistent upgrades bought with intel; nothing here is lost when a run fails

1 Intel balance

Meta currency, earned every run whether or not it succeeded. Losing still progresses the account, which is what keeps the loop bearable.

2 Rig art

The room visibly gains hardware as upgrades are bought — the progress bar we do not have to draw as a progress bar.

3 Upgrade tree

Small and flat on purpose: five to seven nodes, each changing a run-start condition rather than granting raw stats.

4 Locked nodes

Dashed edges show what an owned node leads to. Cost is always visible, so intel can be saved toward a specific unlock.

5 Archetype unlock

The fourth specialisation is bought here, which turns the lock on sheet 4 into a concrete goal.

6 Run history

Last three runs with outcome and how far they got. Failures use the same red as detection everywhere else.

7 New contract

The only exit back into a run. Bottom-right, matching the End turn position in the intrusion screen.

Sources

what these sheets were made from

CYBERHEIST — UI mockups

sheet 11 / 11

layout references

tablet sketches, six pages

Sheets 3 to 6, 8 and 9 are redrawn from the original hand sketches: contract screen, class and deck, map, intrusion screen, shop, and the pause menu. Wording, proportions and annotations added on top; the structure is the sketches'.

genre conventions

Branching run map, one-of-three card rewards and a between-node shop follow the roguelike deckbuilder pattern popularised by Slay the Spire. No screenshots were traced or copied.
